Dear Colleagues:

**Re: Moderna's Spikevax COVID-19 Vaccine Authorized for Children 6-11 Years Old**

Health Canada has authorized Moderna's Spikevax COVID-19 vaccine for children **six to 11** years of age on March 17, 2022. **The same formulation is to be used for all eligible ages; do not dilute Moderna's Spikevax vaccine.** The National Advisory Committee on Immunization has published *Recommendations on the use of Moderna Spikevax COVID-19 vaccine in children 6 to 11 years of age* (2022-03-17) at <https://www.canada.ca/content/dam/phac-aspc/documents/services/immunization/national-advisory-committee-on-immunization-naci/statement-recommendations-use-moderna-spikevax-covid-19-vaccine.pdf>

Effective **immediately**, children **six to 11** years old are eligible to receive 0.25 ml (50 mcg) IM doses of Moderna's Spikevax COVID-19 vaccine for their primary series as an alternative to Pfizer's Pediatric five to 11 years vaccine formulation. **Children younger than six years old are ineligible to be immunized with Moderna's Spikevax vaccine.**

Although no reports of myocarditis or pericarditis were reported in Moderna's clinical trial for children six to 11 years old, the use of the Pfizer-BioNTech's Comirnaty vaccine is preferred to the use of the Moderna's Spikevax vaccine in children to minimize the rare risk of myocarditis and/or pericarditis following vaccination in this age group.

Indirect data from adult populations suggest Moderna's Spikevax may result in higher vaccine effectiveness after a 2-dose primary series compared to Pfizer's Comirnaty and is associated with a higher seroconversion rate among adult immunocompromised patients. Given this potential benefit, administration of Moderna's Spikevax vaccine as a 3-dose primary series may be considered for some immunocompromised individuals six to 11 years of age (NACI, 2022-03-17).

Booster doses for individuals younger than 12 years of age are not recommended at this time.

Sincerely,
